Deployment: AWS EC2

Thursday, February 5, 2026 5:51 PM

Recap:

ML pipe line
↓
Updated ⇒ Expt tracking
↳ features influence perf Model
↓
Updated
Multiple ML algo.
↓
Hyper param Tuning
↓
a Best model with every algo.
↓
Updated Model registry.
Based on Criterions

Best model ← KNN, DT, SVM, GNB, RF, GBDT — 5 model
1) Train Time
2) Test time
3) Model size
↓
from mLflow
↓
a files req for deploy → prepared.

Model Orchestration ⇒ Prefect

A Best model available with.
↳ Already Created a front end with Stream lit
↓
model.pkl file
Code for front end.

Ready for Serving → address → User can access your model

access your model

Query → Address ⟷ Result

Local host
↓
Limited to a particular comp

place model

Cloud platforms (Server)
↓
place cloud server
↓
provide addr → user
↓
user can access it.

Server
↓ Managing.

end point
↓
user
↓
Access it
↓
To do this
↳ any: AWS EC2 Instance
↓
A Cloud Computer

AWS Lambda
AWS Bedrock

AWS account
↓
resource
↓
× Root user ×
↓ Do not use it for any of AWS tasks

Create a new user with req (IAM) permission
↓ use it

without it
MFA (Must)
↓
Microsoft Authenticator

1)

Create a new account

6 Months
↓
Created Aws acc
↓
Sreeram+1@gmail.com
↓
6 Months compl
↓

new AWS account
'Sreeram+1@gmail.com
Sreeram+aws@gmail.com
Sreeram+prod@gmail.com

AWS account → 6M free tier

Sreeram+aws@gmail.com
Sreeram+prod@gmail.com

6 Months Compl → Billable

AWS Topics

1) Sage maker.
2) EC2 Instance
3) Lambda
4) Amazon Bedrock (GenAI)

1) Created EC2 Instance → Updated security groups → added the new sec group to EC2 Instance.

2) Copy files to EC2 Instance from local

scp -r -i 'ml.inference.pem' Source add. (Local) destination add (EC2)

RC → Connect

3) open EC2 Instance

4) Update Ubuntu

Install python3

pip

python3-venv

Install lib

Streamlit numpy pandas

⇒ Streamlit run filename.py

3 add → local

Button → click here → External → browser → Frontend
