Recap: ML flow

→ How to track expt with ml

→ an expt

→ Built KNN algo.

Install ml flow.

hyper par Tu → optuna

→ Install another lib.

→ Code ← optuna - mlflow callbacks.

Import ml flow

optuna ml flow call backs.

↓

Create an obj of optuna ml flow call backs

opt_ml_cb. = MLflow call backs (param_ars)

↓

as an arg to 3 step in optuna

✓1) obj

✓2) Create study

✓3) study.optimize (obj, n_trial = 100, [opt_ml_cb.])

All the data pertaining hpt → stored in ml flow. → Tracked

ml flow → org → Visual → appealing.

→ Analysis

1) How to Create a new Chart

parallel Coord plot

⇒ ml flow Track

Contour plot

⇒ ML flow Track

↳ multiple algo → multiple model

easily vis → effect of every hpt on perf of an algo.

Criterions

1) Generalization

2) Train time → Select a best model For deploy

Real time ← Internet → a lot of data is available → They needs to update model often

3) Test time → How much time it takes gives response when user asked a query.

4) Model size → Costly to host model ↳ cloud platforms.

Model → KNN → Tracked Model → ML flow → Visual

X Rep

SVM → best model 2

DT → 3

RF → 4

NB → 5

GB. → 6.
